

Osisko drills multiple high grade zones at Key Anacon, Bathurst, New Brunswick

Canadian Mining Journal : Headline News Oct 30 2018.

NEW BRUNSWICK – Montreal-based **Osisko Metals** has intersected multiple high grade zinc-lead-copper zones in step-out drilling at the Main zone of its Key Anacon project about 20 km south of the town of Bathurst.

Drill hole KAMZ-18-10, a step-out drill hole 30 metres below the Main zone deposit, intersected **8.30 metres grading 10.47% zinc, 3.47% lead, 0.03% copper, and 92.0 g/t silver.**

Step-out hole, KAMZ-18-15, drilled 100 meters to the northwest of the Main zone deposit, intersected **5.30 metres grading 14.87% zinc, 5.71% lead, 0.01% copper and 294.92 g/t silver, followed by 7.0 metres of 9.85% zinc, 3.82% lead and 126.14 g/t silver.**

Hole KAMZ-18-07, drilled 100 metres below KAMZ-18-15, intersected **3 metres of 5.62% zinc, 1.87% lead, 0.1% copper and 28.04% g/t silver.**

“These new results confirm our theory that high grade mineralization extends beyond the known boundaries. We strongly believe these results are evidence of the exploration upside at depth and along strike,” said Osisko Metals president and CEO Jeff Hussey.

The Key Anacon project includes two known Bathurst-type volcanogenic massive sulphide deposits – Main and Titan. They occur in the same stratigraphic horizon that hosted both the Brunswick No.12 and No.6 zinc-lead deposits, but on the eastern side of what is believed to be a regional fold structure that has not been explored.

Detailed drilling results can be found in the news release dated Oct. 29, 2018, and posted at www.OsiskoMetals.com.
